

Technology

TP Technology presents a combination of numerous scientific procedures that affect molecules in various substances, such as water, glass, plastic, metal, etc., by way of information or code. Founded on 30 years of research, the TP Technology was developed by a group of top inventors who have been awarded over 90 international prizes for their outstanding achievements and inventions.

Through a precise implementation of the TP Technology, one can choose, magnify and imprint specific energy information (vibration). The information is imprinted in numbers, with every number containing hundreds of pieces of information, which are the fruits of decades-long research. The TP Technology can transform matter (water, air...) so that it benefits our well-being, mood and health. The informing process will neutralize negative radiation and information contamination which is, in contrast to quantifiable chemical pollution, not yet tractable.
